

New Year Game

Problem Statement

It's New Year's Day, and Balsa and Koca are stuck inside watching the rain. They decide to invent a game, the rules for which are described below.

Given array a containing n integers, they take turns making a single move. *Balsa always moves first, and both players are moving optimally (playing to win and making no mistakes).*

During each move, the current player chooses one element from a , adds it to their own score, and deletes the element from a ; because the size of a decreases by 1 after each move, a 's size will be 0 after n moves and the game ends (as all elements were deleted from a). We refer to Balsa's score as S_b and Koca's score as S_k . Koca wins the game if $|S_b - S_k|$ is divisible by 3 ; otherwise Balsa wins.

Given a , determine the winner.

Note: $S_b + S_k = a_0 + a_1 + \dots + a_{n-2} + a_{n-1}$.

Input Format

The first line contains an integer, T , denoting the number of test cases.
Each test case is comprised of two lines; the first line has an integer n , and the second line has n space-separated integers $a_0, a_1, \dots, a_{n-2}, a_{n-1}$ describing array a .

Constraints

$1 \leq T \leq 100$
 $1 \leq a_i \leq 2000$
 $1 \leq n \leq 2000$

Subtasks

For 50% score: $1 \leq n \leq 200$
For 100% score: $1 \leq n \leq 2000$

Output Format

For each test case, print the winner's name on a single line; if Balsa wins print **Balsa**, otherwise print **Koca**.

Sample Input

```
2
3
7 6 18
1
3
```

Sample Output

```
Balsa
Koca
```

Explanation

Test Case 1

Array $a = \{7, 6, 18\}$. The possible play scenarios are:

1. $S_b=13$, $S_k=18$, $|S_b-S_k|=5$, and $5 \% 3 \neq 0$.
2. $S_b=24$, $S_k=7$, $|S_b-S_k|=17$, and $17 \% 3 \neq 0$.
3. $S_b=25$, $S_k=6$, $|S_b-S_k|=19$, and $19 \% 3 \neq 0$.

In this case, it doesn't matter what Balsa chooses because the difference between their scores isn't divisible by 3. Thus, Balsa wins.

Test Case 2

Array $a = \{3\}$. Balsa must choose that element, the first move ends the game.

$S_b=3$, $S_k=0$, $|S_b-S_k|=3$, and $3 \% 3 = 0$. Thus, Koca wins.
